Using Blockchains to Transform Video Game Economies

March 13, 2018, 01:07:40 PM EDT By Christopher Tozzi, [Distributed](#)

NITRO – Cryptocurrency for the Video Games Economy

Welcome. NITRO is a revolutionary cryptocurrency aimed to solve the end-to-end industry problem of the US\$100 billion video games industry. NITRO is backed by a credible publicly traded game company and headed by experienced industry experts.

Nitro NOX tokens are now available for trading on [COSS](#) and [LiveCoin](#) exchanges.

For most timely updates on future project announcements, please follow us on [Medium](#) and [Telegram](#)!

Blockchain is games' new tech obsession

Early tech adoption is part of the essence of the games industry - but proposals to integrate blockchain into companies' businesses, not just their games, should give us pause

The tendency to view video games as an entertainment product - part of a spectrum encompassing things like movies, TV shows and music - is an entirely reasonable one. But it can obscure the fact that video games are also often the most advanced, complex and demanding pieces of software that the average consumer will ever use.

The Irrational **Exuberance** That is Blockchain

February 21, 2018

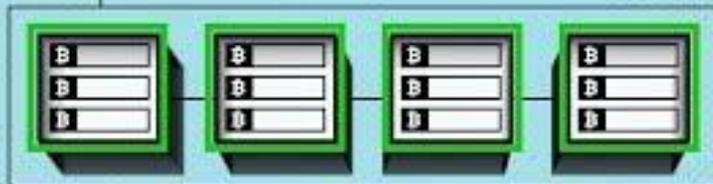

Contributor: Christy Pettey

DIGITAL BUSINESS

IT leaders must cut through the hype and apply blockchain for maximum benefit.

The recent rapid rise and fall in the value of Bitcoin has thrust **blockchain** into our everyday vocabulary and into the minds of most **boards and CEOs**. Blockchain promises genuine long-term potential for global-scale transformation of economies and industries which, over time, will lead to the era of the programmable economy, in which value is exchanged peer-to-peer without central authority, and new exchange mechanisms are created by any participant.

BLOCKCHAIN

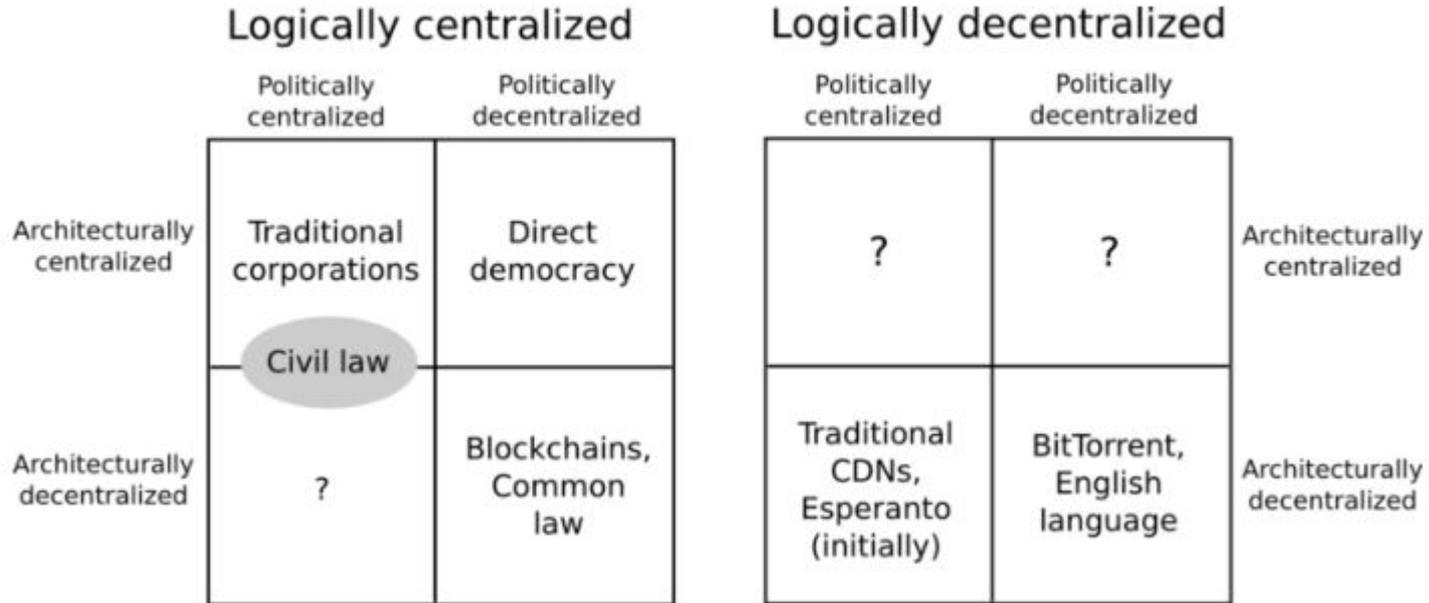

What is blockchain? As per Wikipedia ...

A blockchain is a continuously growing list of records, called blocks, which are linked and secured using cryptography. Each block typically contains a cryptographic hash of the previous block, a timestamp and transaction data. By design, a blockchain is inherently resistant to modification of the data. It is "an open, distributed ledger that can record transactions between two parties efficiently and in a verifiable and permanent way". For use as a distributed ledger, a blockchain is typically managed by a peer-to-peer network collectively adhering to a protocol for inter-node communication and validating new blocks. Once recorded, the data in any given block cannot be altered retroactively without the alteration of all subsequent blocks, which requires collusion of the network majority.

TL;DR - What is blockchain?

- It is a decentralized database, with a built-in incentive model
- Smart contracts are roughly equivalent to stored procedures
- Bitcoin blockchain (Gen 1 - 2008+) can only record balances
- Ethereum (Gen 2 - 2014+) blockchain can contain arbitrary data-structures
- Other, later (Gen 3 - 2016+) blockchains are much the same

What is decentralization?

Three reasons for Decentralization

The next question is, why is decentralization useful in the first place? There are generally several arguments raised:

- **Fault tolerance**— decentralized systems are less likely to fail accidentally because they rely on many separate components that are not likely.
- **Attack resistance**— decentralized systems are more expensive to attack and destroy or manipulate because they lack sensitive central points that can be attacked at much lower cost than the economic size of the surrounding system.
- **Collusion resistance**—it is much harder for participants in decentralized systems to collude to act in ways that benefit them at the expense of other participants, whereas the leaderships of corporations and governments collude in ways that benefit themselves but harm less well-coordinated citizens, customers, employees and the general public all the time.

Some example blockchain projects

- Bitcoin and Bitcoin Cash
- ZCash and Monero
- Ethereum and Cardano
- Ripple and Stellar
- Hyperledger Fabric
- Corda
- RChain
- EOS
- Tezos

Types of project

- Public permissionless blockchain
- Public permitted blockchain
- Consortium blockchain
- Private blockchain

Alternate consensus

- Proof of Work (POW)
- Proof of Stake (POS)
- Delegated Proof of Stake (DPOS)
- Traditional Byzantine Fault Tolerant (BFT)
- Some examples:
 - SHA3
 - Casper
 - Tendermint
 - Ouroboros
 - Raft
 - PBFT

Privacy and confidentiality

- Blockchains are public by default
- Zero knowledge proofs (like zk-SNARKs)
- Ring Signatures
- Private state database (Quorum)

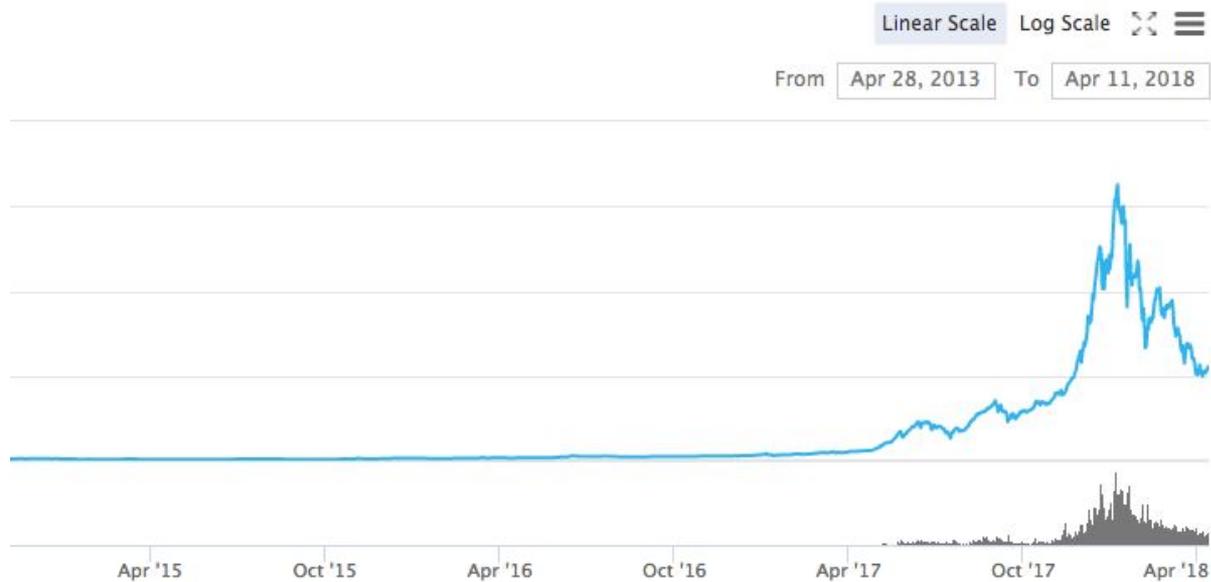

Cryptocurrencies just like the dotcom bubble?

Transformational tech, but overvalued too early

Global Charts

Total Market Capitalization

There are many “videogame coin” projects

- EnjinCoin
- GameCredits
- DMarket
- ABYSS
- PlayKey
- Game Machine
- Game Protocol

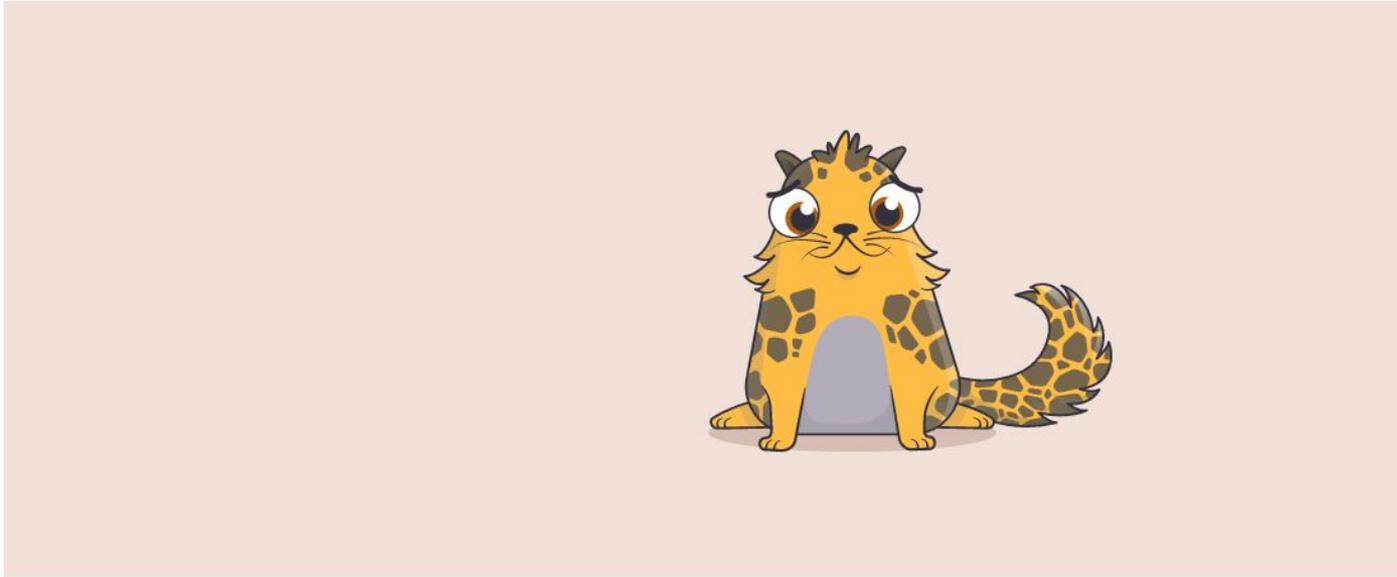

I personally see close to zero short-term value in any of them. Maybe such a project will make sense in 2-3 years time? Maybe.

3. Crypto-All Stars

Stay Away

Updated: Avoid like the plague. One of the Developers sold his ownership to someone who has no plans to further the game.

The image shows a promotional graphic for 'Crypto All Stars' NFTs. On the left, a purple background contains the text: 'Your favorite shitposters are now on the blockchain. And you can own their only Smart Contract.' Below this, it says 'Buy and sell collectible Crypto All Star Smart Contracts on the blockchain.' On the right, a screenshot of an NFT listing is shown. The listing features a profile picture of a cartoon character, the name 'Crypto Randy Marsh' with the handle '@nondualnelly', and a '#0' badge. The text 'i like turtles' is visible below the name. At the bottom of the listing, it shows 'Transactions: 10 | Price: 0.004 eth' and a yellow 'PURCHASE CONTRACT' button. A 'share' link is partially visible at the bottom left of the listing area.

World Of Ether

An upcoming game already has cryptocollectible addicts losing their minds and it hasn't even launched yet.. This game has the potential to be by far the biggest Ethereum games ever

Private/consortium blockchain for fraud prevention

- Strong analogy with use of private blockchains in financial institutions
- Consistency of information across multiple systems / entities
- In finance, that is retail banks, plus central bank and regulators
- For video games, that is publishers, plus platform holders
- Platforms = XBOX LIVE, PlayStation Store, App Store, Google Play, Steam
- Publishers = EA (Origin), Activision, King, Tencent, etc
